

11/30/66

In general, all processing is similar to that described in one or more of the following documents:

- 1. ATM 399B
- 2. ATM 547
- 3. SE 03
- 4. ATM 536
- 5. ICS 314104

particularly:

- ATM 577
- ATM 580
- ATM 581
- ATM 582
- ATM 583

Specifically, due to the availability of only one high-speed line printer, automatic time-sharing of the line printer will not be permitted. Therefore, even though two or more experiments are operating simultaneously and processing for all these experiments is on-going, line printer output for these experiments is mutually exclusive.

This does not exclude any mainframe sync diagnostics, word 33 output, or word 46 output, i. e. these outputs will automatically time-share the line printer with the experiment being outputted at that given time. Re-stating the above: Only one experiment will be printing output on the line printer at a time; control over what experiment will be outputted, is by sense switch selection.
